

BuildOrbit Enterprise User Manual

Welcome to the BuildOrbit Enterprise platform. This comprehensive manual details the operational procedures, workflows, and strict Role-Based Access Control (RBAC) mechanisms that govern the platform.

BuildOrbit unifies Human Resources Management (HRMS), Customer Relationship Management (CRM), and Workforce Operations into a single, cohesive interface.

1. Role-Based Access Control (RBAC) Architecture

BuildOrbit employs a hierarchical access model. Every user is assigned a specific role that fundamentally dictates what modules they can view and what actions they can perform.

1.1 Super Admin (SUPER_ADMIN)

The highest level of privilege in the system.

- **Capabilities:** Full oversight of the entire platform. Can access the Admin configuration panels, modify global organization settings, inspect sensitive audit logs, and override system locks.
- **Restrictions:** None.

1.2 Administrator (ADMIN)

Designed for department heads and senior operations managers.

- **Capabilities:** Full read/write access to HR and CRM modules. Can view high-level business dashboards and pipeline metrics.
- **Restrictions:** Cannot access system-level settings, database configurations, or security audit logs.

1.3 Human Resources (HR)

Designed for HR professionals managing the workforce.

- **Capabilities:** Exclusive access to the HR Management suite. This includes approving/rejecting leave requests, processing monthly payroll, generating payslips, creating employee shift schedules, and onboarding new employees.
- **Restrictions:** Cannot access the CRM (Sales) modules or system administrative settings.

1.4 Sales Lead (LEAD)

Designed for sales executives and CRM pipeline managers.

- **Capabilities:** Exclusive access to the CRM suite. Can create, assign, and qualify Sales Leads, log follow-up notes, and generate binding Invoices for closed deals.
- **Restrictions:** Cannot view other employees' payroll data, cannot manage HR leave requests, and cannot access system settings.

1.5 Employee / Engineer (ENGINEER)

The standard access level for the general workforce.

- **Capabilities:** Access to their personal Workforce dashboard. Can mark daily attendance, submit leave requests (and upload medical certificates), view assigned shifts, and download personal PDF payslips.
 - **Restrictions:** Cannot view or manipulate data belonging to any other user.
-

2. Workforce Operations (Employee & HR Workflows)

2.1 Daily Attendance Tracking

- **Check-In:** Employees must log into their dashboard at the start of their shift and click "Check In". The system records the exact timestamp.
- **Check-Out:** Upon completing their shift, employees click "Check Out".
- **Automated Failsafe:** If an employee forgets to check out, a nightly cron job will automatically close their attendance record at 23:59 to prevent infinite time logging.

2.2 Shift Management

- **Creation (HR Only):** HR navigates to `HR Management > Shifts` to define standard working hours (e.g., "Morning Shift: 09:00 to 17:00").
- **Assignment (HR Only):** Using the integrated dropdown on the shift card, HR assigns specific employees to the shift. This assignment instantly dictates the employee's expected attendance window.

2.3 Leave Request & Approval Workflow

1. **Application:** An employee navigates to `Workforce > Leave` and submits a request specifying dates, leave type (e.g., Sick, Casual), and optionally uploads supporting documentation.
2. **Notification:** The system automatically dispatches an email alert to the HR department.
3. **Approval:** HR navigates to `HR Management > Leave Approval` to review the request.
4. **Execution:** Upon approval, the system recalculates the employee's remaining leave balance in real-time, preventing over-drafting of allotted days.

2.4 Payroll Generation

- **Drafting:** At the end of the month, HR navigates to `HR Management > Payroll` to review automatically generated draft payslips. The system calculates base salary, deducts unpaid absences, and applies standard allowances.
 - **Finalization:** HR marks the payroll as "Paid".
 - **Distribution:** Employees can immediately download their secure PDF payslips from `Workforce > Payslips`.
-

3. CRM & Sales Operations (Lead Workflows)

3.1 Lead Pipeline Management

- **Creation:** Sales Leads navigate to `CRM > Leads` to enter new prospect data, ensuring the crucial "Contact Person Name" and "Company" fields are accurately recorded.
- **Tracking:** Leads move through distinct phases: `NEW` → `CONTACTED` → `QUALIFIED` → `PROPOSAL` → `CONVERTED`.
- **Follow-ups:** Sales representatives must log detailed follow-up notes against the lead record to maintain a historical timeline of negotiations.

3.2 Invoice Generation

Once a Lead is successfully `CONVERTED` :

1. The Sales Lead navigates to `CRM > Invoices`.
2. They click "Create Invoice" and select the respective Client from the system.

3. After inputting the negotiated invoice amount and due date, the invoice is securely generated and logged into the financial reporting dashboard.
